Type Of Sample : BLOOD Collection Time: 05-01-2023 01:30 PM

Test Name

TYPHOID IgM & IgG

By :

INVESTIGATION	RESULT
TYPHI IgM	Non - Reactive
TYPHI IgG	Non - Reactive

- IgM Positive or IgM/IgG both Positive suggest current infection.
- while IgG Positive suggests late stage of infection, previous infection or latent infection.
- A negative result for as individual subject indicates absence of detectable anti- S typhi or S-paratyphi antibodies.
- Kindly correlate clinically.

DENGUE (NSI, IgM & IgG) BY RAPID

By :

DENGUE NSI	Non - Reactive
DENGUE IgM	Non - Reactive
DENGUE IgG	Non - Reactive

IMPRESSION:

(1) The level of dengue NSI antigen, IgG and IgM antibodies vary depending on the stage of disease in early infection and in some secondary infection detectable levels of IgM antibodies may be low. some patients may not produce detectable levels of antibody within the first seven to ten days infection

If the test result is negative and clinical symptoms persist, a second specimen should be collected 3-4 days later.

(2) A negative result can occur if the dengue NSI antigen or dengue antibodies present in the specimen are below the detectable level when the sample was collected. A negative test result does not exclude the possibility of dengue infection.

(3) As with all diagnostic tests, results must be considered with other clinical information available with the physician.
